

# Now is not the time to ignore your cyber wellness!

**ANJOLEN**  
Securing Your Cyber Future

With so many organizations now working remotely as we navigate COVID-19, your business faces remote connection capacity challenges and increased cybersecurity vulnerabilities. At Anjolen, our focus is to keep your organization functioning and secure with the following services:

## Remote Connection Stress Testing

Anjolen will conduct stress testing of your organization's VPN system to simulate a large number of employees working remotely. This testing is designed to identify any weakness or vulnerability that would prohibit remote work by your organization/business' entire workforce. It can assist in identifying limits of your current infrastructure.

## Remote User Cybersecurity Training

This on-demand webinar explores critical considerations necessary to improve your remote employees' security. Your employees learn about the most important items they need to know now to prepare for today's new risks from working remotely. Best practices and precautions are discussed regarding targeted phishing attacks, PII (Personally Identifiable information) and PHI (Protected Health Information) compliance, passwords, personal device usage, secure remote connectivity, and phone use.

## Remote Connection Security Testing

Protect your sensitive data including PII and PHI by testing the security of your remote connection to ensure that all data stays in the tunnel and stays encrypted. This testing also ensures that the destination VPN is properly segmented, so users only have access to the data they should have privileges to.

## Attack Exposure Identification

Anjolen will identify your business/organization's exposure to attacks by examining open-source intelligence (OSINT), breached database information, and third-party websites for data that can be leveraged by an attacker. This includes leaked usernames and passwords.
